

# Next Generation Data Protection

## SERVICE OVERVIEW

Organizations are modernizing their data centers with investments in server virtualization, modern storage applications and cloud based services. This is done in order to meet increasing user requirements for data access as well as the business demands to lower operational costs, provision IT services faster, increase security and increase business agility. **Other organizations are settling for legacy backup solutions where they continue to face shortcomings like:**

**01**

*Lengthy Recovery Time Objectives (RTO) and Recovery Point Objectives (RPO) of hours and days.*

**02**

*Less than **6%** of backups tested each quarter.*

**03**

*More than **16%** of backups fail to recover.*

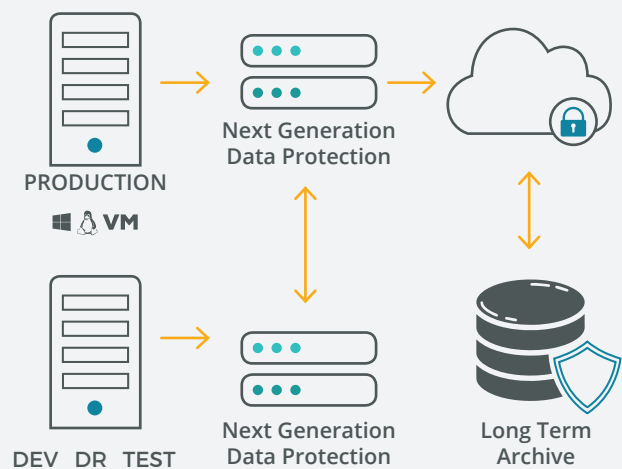

## PROBLEM

The legacy systems are hard to maintain and support and don't allow for the rapid discovery and recovery of information or efficient, reliable storage.

## HOW WE CAN HELP

This service offering provides Next Generation Data Protection (NGDP) on ENS-Inc Storage as a Service (STaaS). This service will:

- Migrate data from customer environment to ENS-Inc STaaS.
- Catalog data.
- Configuration of scheduled backup for customer defined environment.

## KEY DIFFERENTIATORS

### Key deliverables for NGDP:

- Custom architecture design for protection of customer's data in ENS-Inc STaaS.
- Detailed Work Authorization for the supporting services required to setup the data protection.
- Customer portal to control and manage ENS-Inc STaaS protected data.

### NGDP solution provides protection for:

- Systems and storage in the CDT and ENS-Inc data centers or at your site(s).
- Virtual or physical Windows and Linux systems.
- NAS shares.
